This Service manual is issued as a service guide for the models of the **NA7D** family listed above. Included are schematics, alignment procedures, disassembly procedures, and a parts list.

“WARNING! This Service Manual is designed for experienced repair technicians only and is not designed for use by the general public. It does not contain warnings or cautions to advise non-technical individuals of potential dangers in attempting to service a product. **Products powered by electricity should be serviced or repaired only by experienced professional technicians.** Any attempt to service or repair the product or products dealt with in this Service Manual by anyone else could result in serious injury or death.”

The service technician is required to read and follow the **“Safety Precautions”** and **“Important Safety Notice”** in this Manual.

Quasar

Important Safety Notice

Special components are used in this television set which are important for safety. These parts are identified on the schematic diagram by the symbol  and printed in **BOLD TYPE** on the replacement part list. It is essential that these critical parts are replaced with the manufacturer's specified replacement part to prevent X-ray radiation, shock, fire or other hazards. Do not modify the original design without the manufacturer's permission.

Safety Precautions

General Guidelines

An **Isolation Transformer** should always be used during the servicing of a Receiver whose chassis is not isolated from AC power line. Use a transformer of adequate power rating as this protects the technician from accidents resulting in personal injury from electrical shocks. It will also protect the Receiver from being damaged by accidental shorting that may occur during servicing.

When servicing, observe the original lead dress, especially in the high voltage circuit. Replace all damaged parts (also parts that show signs of overheating.)

Always Replace Protective Devices, such as fishpaper, isolation resistors and capacitors, and shields after servicing the Receiver. Use only manufacturer's recommended rating for fuses, circuits breakers, etc. High potentials are present when this Receiver is operating. Operation of the Receiver without the rear cover introduces danger for electrical shock. Servicing should not be performed by anyone who is not thoroughly familiar with the necessary precautions when servicing high-voltage equipment.

Extreme care should be practiced when **Handling the Picture Tube**. Rough handling may cause it to implode due to atmospheric pressure. (14.7 lbs per sq. in.). Do not nick or scratch the glass or subject it to any undue pressure. When handling, use safety goggles and heavy gloves for protection. **Discharge the picture tube** by shorting the anode to chassis ground (not to the cabinet or to other mounting hardware). When discharging connect cold ground (i.e. dag ground lead) to the anode with a well insulated wire or use a grounding probe.

Avoid prolonged exposure at close range to unshielded areas of the picture tube to prevent exposure to X-ray radiation.

The **Test Picture Tube** used for servicing the chassis at the bench should incorporate safety glass and magnetic shielding. The safety glass provide shielding for the tube viewing area against X-ray radiation as well as implosion. The magnetic shield limits the X-ray radiation around the bell of the picture tube in addition to the restricting magnetic effects. When using a picture tube test jig for service, ensure that the jig is capable of handling **50kV** without causing X-ray radiation.

Before returning a serviced Receiver to the owner, the service technician must thoroughly test the unit to ensure that is completely safe to operate. **Do not use a line isolation transformer when testing.**

Leakage Current Cold Check

Unplug the AC cord and connect a jumper between the two plug prongs.

Measure the resistance between the jumpered AC plug and expose metallic parts such as screwheads, antenna terminals, control shafts, etc. If the exposed

metallic part has a return path to the chassis, the reading should be between 240k Ω and 5.2M Ω . If the exposed metallic part does not have a return path to the chassis, the reading should be infinite.

Leakage Current Hot Check (Fig. 1)

Plug the AC cord directly into the AC outlet. Do not use an isolation transformer during the check.

Connect a 1.5k Ω 10 watt resistor in parallel with a 0.15 μ F capacitor between an exposed metallic part and ground. Use earth ground, for example a water pipe.

Using a DVM with a 1000 ohms/volt sensitivity or higher, measure the AC potential across the resistor.

Repeat the procedure and measure the voltage present with all other exposed metallic parts.

Verify that any potential does not exceed 0.75 volt RMS. A leakage current tester (such a Simpson Model 229, Sencore Model PR57 or equivalent) may be used in the above procedure, in which case any current measure must not exceed 0.5 milliamp. If any measurement is out of the specified limits, there is a possibility of a shock hazard and the Receiver must be repaired and rechecked before it is returned to the customer.

Figure 1. Hot Check Circuit

X-ray Radiation

WARNING: The potential source of X-ray radiation in the Receiver is in the High Voltage section and the picture tube. Refer to "X-Ray Protection Circuit Check & Adjustments" on page 5 to confirm HHS voltage.

High Voltage (CRT Anode)

Set the **brightness, picture, sharpness** and **color** controls to minimum (to obtain dark image). Measure the High Voltage. The high voltage should be **29.25kV \pm 1.25kV**. If the upper limit is out of tolerance, immediate service and correction is required.

Note: It is important to use an accurate, calibrated high voltage meter.

Service Notes

Note: Some components may be affixed with glue. Be careful not to break or damage foil under the component or at the pins of the ICs when removing. Usually applying heat to the component for a short time while twisting with tweezers will break the component loose.

Leadless Chip Component

(surface mount)

Chip components must be replaced with identical chips due to critical foil track spacing. There are no holes in the board to mount standard transistors or diodes. Some chips capacitor or resistor board solder pads may have holes through the board, however the hole diameter limits standard resistor replacement to 1/8 watt. Standard capacitor may also be limited for the same reason. It is recommended that identical components be used.

Chip resistor have a three digit numerical resistance code - 1st and 2nd significant digits and a multiplier. Example: 162 = 1600 or 1.6k Ω resistor, 0 = 0 Ω (jumper). Chip capacitors generally do not have the value indicated on the capacitor. The color of the component indicates the general range of the capacitance.

Chip transistors are identified by a two letter code. The first letter indicates the type and the second letter, the grade of transistor.

Chip diodes have a two letter identification code as per the code chart and are a dual diode pack with either common anode or common cathode. Check the parts list for correct diode number.

Component Removal

1. Use solder wick to remove solder from component end caps or terminal.
2. Without pulling up, carefully twist the component with tweezers to break the adhesive.
3. Do not reuse removed leadless or chip components since they are subject to stress fracture during removal.

Chip Component Installation

1. Put a small amount of solder on the board soldering pads.
2. Hold the chip component against the soldering pads with tweezers or with a miniature alligator clip and apply heat to the pad area with a 30 watt iron until solder flows. Do not apply heat for more than 3 seconds.

Chip Components

How to Replace Flat-IC

- Required Tools -

- Soldering iron
 - Needle nose pliers
 - Wire cutters (sharp & small)
 - De-solder braids
 - Magnifier
1. Cut the pins of a defective IC with wire cutters. Remove IC from board. If IC is glued to the board, heat the IC and release the IC. See Note above.

2. Using soldering iron and needle nose pliers remove the IC pins from the board.

3. Using de-soldering braid and soldering iron remove solder from affected area on board (pads).

4. Position the new Flat-IC in place (apply the pins of the Flat-IC to the soldering pads where the pins need to be soldered). Determine the positions of the soldering pads and pins by correctly aligning the polarity symbol. Solder pin #1 first, align the IC.

Solder the pin opposite to pin #1. This will assist positioning the IC.

5. Solder all pins to the soldering pads using a fine tipped soldering iron.

6. Check with a magnifier for solder bridge between the pins or for dry joint between pins and soldering pads. To remove a solder bridge, use a de-solder braid as shown in the figure below.

IMPORTANT: To protect against possible damage to the solid state devices due to arcing or static discharge, make certain that all ground wires and CRT DAG wire are securely connected.

CAUTION: The power supply circuit is above earth ground and the chassis cannot be polarized. Use an isolation transformer when servicing the Receiver to avoid damage to the test equipment or to the chassis. Connect the test equipment to the proper ground (⚡) or (↗) when servicing, or incorrect voltages will be measured.

WARNING: This Receiver has been designed to meet or exceed applicable safety and X-ray radiation protection as specified by government agencies and independent testing laboratories.

To maintain original product safety design standards relative to X-ray radiation and shock and fire hazard, parts indicated with the symbol  on the schematic must be replaced with identical parts. Order parts from the manufacturer's parts center using the parts numbers shown in this service manual, or provide the chassis number and the part reference number.

For optimum performance and reliability, all other parts should be replaced with components of identical specification.

X-Ray Protection Circuit Check & Adjustments

This test must be performed as final check before the Receiver is returned to the customer. If voltages are out of tolerance, immediate service and correction is required to insure safe operation and to prevent the possibility of premature component failure.

Equipment:

1. Isolation transformer.
2. High voltage meter.
3. Short jumper.
4. Jumper diode (same as D823, PN S3L60P154004). Diode should be rated a minimum of 150V.

Procedure:

1. Connect the Receiver to an isolation transformer. Turn Receiver ON.
2. Apply a monoscope pattern.
3. In Service Mode (see Service Mode Section in this manual) select register Cb.
4. Measure TP5 (located near the tuner). Compare the measured value to the left column of the table below. Set Cb with value from the right column corresponding to the measured level at TP5. Example, if the measured level at TP5 is 1.03V, set Cb to 03.

TP5 MEASUREMENT	SET Cb TO (HEX)
0 ~ 0.93V	00
0.93 ~ 0.97V	01
0.97 ~ 1.01V	02
1.01 ~ 1.05V	03
1.05 ~ 1.09V	04
1.09 ~ 1.13V	05
1.13 ~ 1.17V	06
1.17 ~ 1.21V	07

5. Exit Service Mode and shut it OFF.
6. Connect the short jumper between TPD16 and TPD17.
7. Connect the jumper diode between TPD14 and TPD15 (cathode connected to TPD14, anode connected to TPD15, See Fig. 4 for locations).
8. Apply 75VAC to the input of the isolation transformer.
9. Turn Receiver ON.
10. Set PICTURE and BRIGHTNESS to minimum.
11. Slowly increase the voltage at the input of the isolation transformer and confirm HHS voltage measure **35.0KV** for **25" models**, **35.8KV** for **27" models** using **SAMSUNG CRT** or **35.0KV** for **27" models** using **AMEC CRT** when the Receiver starts to go out of sync.
12. Turn Receiver OFF and remove jumper & diode.

Table 1. Receiver Features

Specifications are subject to change without notice or obligation.
Dimensions and weights are approximate.

* **Note:** When ordering a replacement board assembly, append an "S" to the board number.
Example: to order the A-Board for CT-27G6E, the replacement board is TNP2AH024BBS.

Location of Receiver Controls

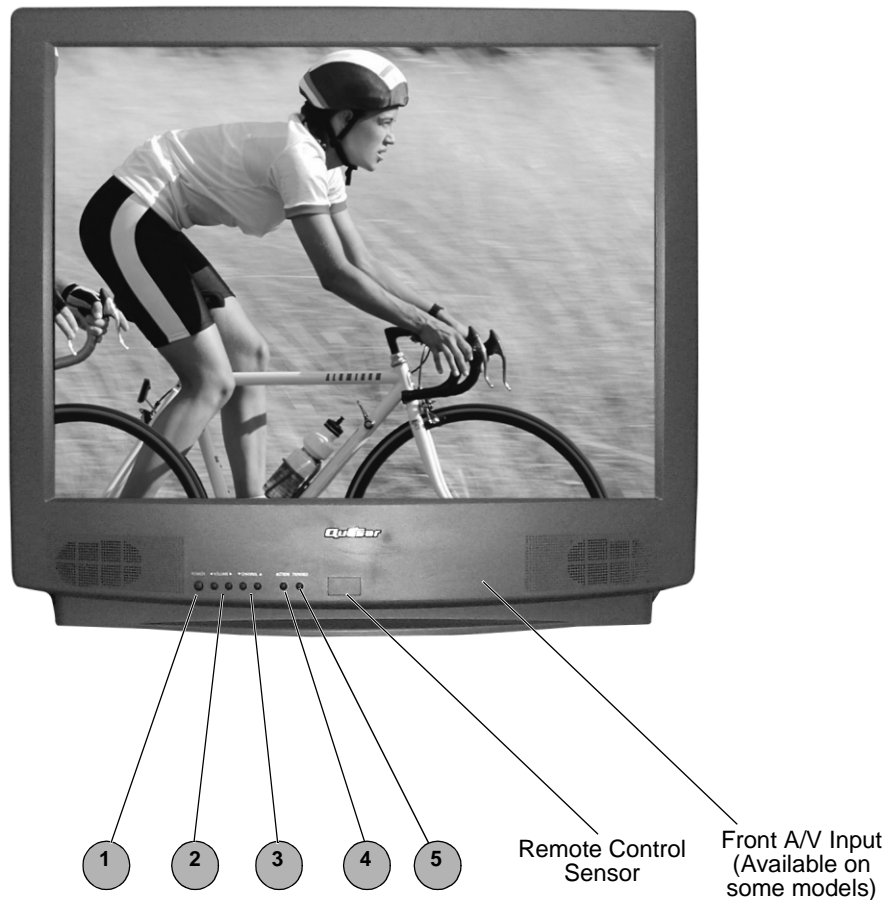

Figure 2. Location of Controls (Quasar models displayed, Panasonic models vary).

Quick Reference Control Operation	
1	Power Button - Press to turn ON or OFF.
2	Volume Buttons - Press to adjust Sound Level, or to adjust Audio Menus, Video Menus, and select operating features when menus are displayed
3	Channel Buttons - Press to select programmed channels. Press to highlight desired features when menus are displayed. Also use to select Cable Converter box channels after programming Remote Control Infra-red codes (the TV/AUX/CABLE switch must be set in CABLE position).
4	Action Button - Press to display Main Menu and access On Screen feature and Adjustment Menus.
5	TV/Video Button - Press to select TV or Video Input.

Location of Controls

**EUR511514
(Typical)**

Figure 3. Location of Controls (Quasar models, Panasonic remotes vary).

Disassembly for Service

Back Cover

Remove all the screws marked with an arrow() from the back of the Receiver.

Note: *Screw configuration, type, and number of screws vary depending on the model of the Receiver serviced; various models are covered in this Manual. Reuse hardware when reassembling the Receiver.*

- 3 screws at the top edge of the Receiver.
- 1 screw at each lower corner of the Receiver.
- 1 screw by the AC cord assembly.
- 1 screw by the A/V jacks.
- 1 screw by the Flyback assembly.

A-Board - Main Chassis

1. Slide the chassis completely out of the guide rails.
2. Stand the Receiver on its edge. The underside of the board is completely accessible for component replacement.

Note: *Some tie-wraps that secure the wire dressings may need to be unfastened for chassis removal.*

C-Board - CRT Output

The board plugs onto the socket on the CRT neck. To release the Focus wire, use a dull object to release the tab on the socket (near the wire opening) and carefully pull on the wire. To connect the Focus wire, press on the tab to lock it then insert the wire in the opening and press on it until it is fully inserted and locked in place.

Speakers

Each speaker is secured to the cabinet's front with 2 screws.

Keyboard Push Button Assembly

Fastened with screws to the inside of the cabinet front.

Disassembly for CRT Replacement

1. Discharge the CRT as instructed in the **Safety Precautions** (see page 2).
2. Disconnect the yoke (DY) plug, degaussing coil (DEG) plug from the main board.
3. Unplug the CRT 2nd anode button from the main board.
4. Remove the C-Board from the CRT base and unplug the black wire (CRT dag ground) C10.
5. Disconnect the A11, A12, and Speakers plugs from the A-Board.
6. Lift the Main Chassis (A-Board) and all mounted boards completely out with the CRT Board attached.

CRT Replacement

1. Perform **Disassembly for CRT Replacement** procedure.
2. Insure that the CRT H.V. Anode button is discharged before handling the CRT. Read the **Safety Precautions** (see page 2 on handling the picture tube.)
3. Remove the components from the CRT neck and place the cabinet face down on a soft pad.
4. Note the original order for the CRT mounting hardware as they are remove from the CRT mounting brackets at each corner of the CRT.
5. Remove the CRT with the degaussing coil and the dag ground braid attached.
6. Note the original locations and mounting of the degaussing coil and the dag ground assembly to insure proper reinstallation on the replacement CRT.

To remove and re-mount the degaussing coil: The degaussing coil is held in place by clampers fastened to the CRT corner ears. These clampers must be installed onto the replacement CRT prior to mounting the degaussing coil.

To remove and re-mount the dag ground braid:

- a. Unhook the coil spring from the bottom corners of the CRT ears.
 - b. Release the braid loop from the upper corners of the CRT ears.
7. Mount the dag ground braid on the replacement CRT. Position the degaussing coil with new ties. Dress coil as was on the original CRT.
 8. Replace the components on CRT neck and reinstall into cabinet. Verify that all ground wires and circuit board plugs get connected.

Chassis Service Adjustment Procedures

All service adjustments are factory preset and should not require adjustment unless controls and/or associated components are replaced.

Note: Connect the (-) lead of the voltmeter to the appropriate ground. Use IC801's heat sink when the HOT ground symbol (⚡) is used. Otherwise, use COLD ground (⚡) — Tuner shield, IC451's heat sink or FA2.

Figure 4. A-Board Main Components and Test Points (Components within dotted areas are located on trace side)

MOMENTARILY CONNECT A JUMPER TO ENTER SERVICE MODE (FA1 to FA2)

130.0V B+ Voltage Confirmation

1. Set the **Bright** and the **Contrast** to Minimum by using the Picture Menu.
2. Connect the DVM between C825 (+ side) or TPD14 and cold ground (⚡).
3. Confirm that B+ voltage is **130.0V ± 2.5V**. This voltage supplies B+ to the Horizontal Output & Flyback circuits.

Source Voltage Chart

120V AC line input. Set the **Bright** and the **Picture** to Minimum by using the Picture Menu. Use cold ground (⚡) for the (-) lead of the DVM.

LOCATION	VOLTAGE
TPD8	26.0V ± 2.0V
TPD9	13.0V ± 2.0V
IC551 Pin3	9.0V ± 0.25V
IC552 Pin3	5.0V ± 0.25V
D554 Cathode	220V ± 15V

Adjust Picture Menu for normalized video adjustments.

High Voltage Check

1. Select an active TV channel and confirm that horizontal is in sync.
2. Adjust Brightness and Contrast using Picture Icon menu so video just disappears.
3. Confirm B+ 131V is within limit.
4. Using a high voltage meter confirm that the High Voltage is **29.25kV ± 1.25kV**.

Purity and Convergence Procedure

Adjustment is necessary only if the CRT or the deflection yoke is replaced or if the setting was disturbed. The complete procedure consists of:

1. Vertical Raster Shift Adjustment. (**Only for Models with Purity/Convergence Assembly with 4 Pairs of Rings**).
2. Initial static convergence.
3. Setting the purity.
4. Final static convergence.

When the CRT or the Yoke is Replaced

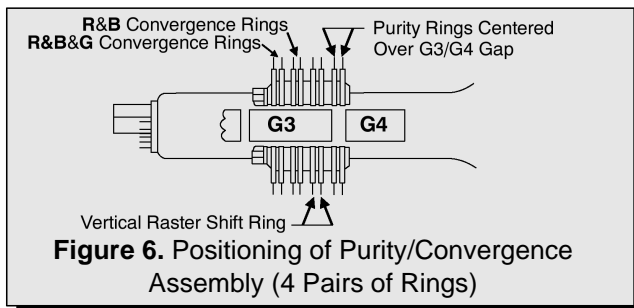

Place the yoke on the CRT neck (do not tighten the clamp).

For a 2-piece assembly (see Fig. 5):

Position purity/convergence assembly as shown and tighten clamp snugly. Remove the hot-melt glue seal on assembly and position like tabs of purity device together at 12 o'clock to reduce its magnetic field effect.

For models using 4 pairs of rings, place the vertical raster shift tabs at 3 o'clock (90° from the purity and convergence tabs, see Fig. 6 and Fig. 7).

For a 1-piece assembly (see Fig. 8):

Position like tabs of purity devices together at 12 o'clock to reduce any magnetic field effect. (For better

results, note part number and look for specifications at Service Center)

For either assemblies:

Turn the Receiver ON. Operate the Receiver for 60 minutes using the first Purity Check field (white screen) to stabilize the CRT.

Fully degauss the Receiver by using an external degaussing coil.

Slide the deflection yoke back and forth on the neck of the CRT until it produces a near white, uniform raster.

Vertical Raster Shift Adjustment (Only for Models with Purity/Convergence Assembly with 4 Pairs of Rings).

Apply a green pattern with a horizontal line, adjust the Deflection Yoke so that has no tilt, then secure it. Adjust center line of the pattern with the mechanical center of the CRT, this center is determined by two marks at the side edges of the screen. To adjust the line, once the vertical raster shift tabs are placed at 3 o'clock to reduce its magnetic field effect (see Fig. 6 and Fig. 7) open the tabs the same angle from the center, until the center line of the pattern becomes a straight line, centered with the marks of the CRT. (see Fig. 9.)

Figure 9. Vertical Raster Shift Adjustment (4 pairs of rings assembly)

Initial Center Static Convergence

Connect a dot/cross hatch generator to the Receiver and tune in a signal. Observe misconvergence at center of the screen only.

Adjust the R & B pole magnets; by separating tabs and rotating to converge blue with red.

Adjust the R & B and R & B & G pole magnets: by separating tabs and rotating to converge blue and red (magenta) with green.

Note: Precise convergence at this point is not important.

Purity Adjustment

When the Receiver is in the Service Mode for making electronic adjustments, press the **Recall** button on the Remote Control to enter Purity Check. (See the **Service Adjustments Electronic Controls** procedure). Operate the Receiver for 60 minutes using the first Purity Check field (white screen) to stabilize the CRT. Fully degauss the Receiver by using an external degaussing coil.

Press the **Recall** button on the Remote Control again until the Purity Check (green screen) appears.

For a 2-piece assembly (see Fig. 5):

Loosen the deflection yoke clamp screw and move the deflection yoke back as close to the purity magnet as possible.

Adjust the Purity rings to set the vertical green raster precisely at the center of the screen (see Fig. 10).

Slowly move the deflection yoke forward until the best overall green screen is displayed.

For a 1-piece assembly (see Fig. 8):

Slowly move the deflection yoke and purity rings assembly toward the CRT board and adjust the purity magnet rings to set vertical green raster at center of screen (see Fig. 10).

Gradually move the deflection yoke & purity rings forward and adjust for best overall green screen.

Continue from here for either assemblies:

Tighten the deflection yoke clamp screw.

Press the **Recall** button on the Remote Control again until the purity check (blue screen) and (red screen) appear and observe that good purity is obtained on each respective field.

Press the **Recall** button on the Remote Control again until Purity check (white screen) appears. Observe the screen for uniform white. If purity has not been achieved, repeat the above procedure.

Final Convergence Procedure (see Fig. 11 through Fig. 13):

Note: *Vertical size and focus adjustments must be completed prior to performing the convergence adjustment. Connect a dot pattern generator to the Receiver. The **Brightness** level should not be higher than necessary to obtain a clear pattern.*

Converge the red and the blue dots at the center of the screen by rotating the R & B pole Static Convergence Magnets.

Align The converged red/blue dots with the green dots at the center of the screen by rotating the R & B & G pole Static Convergence Magnets. Melt wax with soldering iron to reseal the magnets.

Slightly tilt vertically and horizontally (do not rotate) the deflection yoke to obtain a good overall convergence.

If convergence is not reached at the edges, insert permalloy (see following section) from the DY corners to achieve proper convergence. Recheck for purity and readjust if necessary.

After vertical adjustment of the yoke, insert wedge at 11 o'clock position, then make the horizontal tilt adjustment.

Secure the deflection yoke by inserting two side wedges at 3 and 7 o'clock positions.

Apply adhesive between tab (thin portion) of wedge and CRT and place tape over the tab to secure to the CRT.

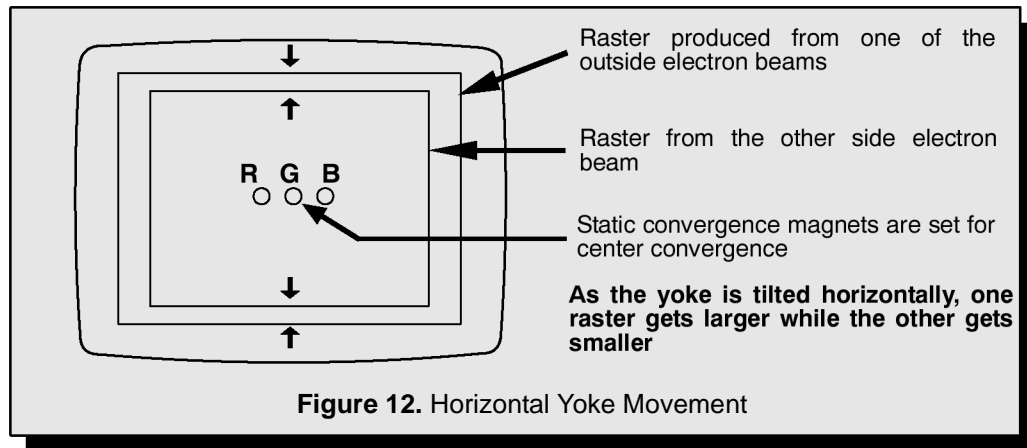

Permalloy Convergence Corrector Strip (Part No. 0FMK014ZZ)

This strip is used in some sets to match the yoke and CRT for optimum convergence. If the yoke or CRT is replaced, the strip may not be required.

First converge the set without the strip and observe the corners.

If correction is needed:

1. Place strip between CRT and yoke, in quadrant needing correction. Slowly move it around for desired results.
2. Press adhesive tightly to the CRT and secure with tape.

Note: For models using 4 pairs of rings assemblies see Fig. 6 for details

Service Mode (Electronic Controls)

This Receiver has electronic technology using the I²C Bus Concept. It performs as a control function and it replaces many mechanical controls. Instead of adjusting mechanical controls individually, many of the control functions are now performed by using "On Screen Display Menu". (The **Service Adjustment Mode**.)

Note: *It is suggested that the technician reads all the way through and understand the following procedure for Entering/Exiting the **Service Adjustment Mode**; then proceed with the instructions working with the Receiver. When becoming familiar with the procedure, the Flow Chart for Service Mode may be used as a quick guide.*

Quick Entry to Service Mode:

At times when minor adjustments need to be done to the electronic controls, the method of Entering the service Mode without removal of the cabinet back is as follows using the Remote Control:

1. Adjust VOLUME to minimum (0).
2. Set CC Mode (Close Caption) OFF.
3. Select SET-UP icon and select CABLE mode.
4. Select TIMER icon and set SLEEP time for 30, 60 or 90 Min.
5. Press ACTION button twice to exit menus.
6. Tune to the Channel 124.
7. Press the VOL ◀ button (decrease) **on Receiver**. Red "CHK" appears in the left upper corner.

To toggle between Aging and Service modes:

While the "CHK" is displayed on the left top corner of the CRT, pressing the Action and the Volume Up buttons on the Receiver simultaneously will toggle between the modes. Red "CHK" for Service and yellow "CHK" for Aging.

Note: *Three additional indicators appear on screen. One is the five digit usage in hours and the other two are four digits for V-Chip Main and Child ratings. Indicators are hexadecimal numbers.*

8. **Press the Power Button on the Remote Control** to select one of seven Service Adjustment Modes.
 1. **B**= Service VCJ SUB-DATA adjustments.
 2. **C**= Service VCJ CUT-OFF adjustments.
 3. **M**= Service MTS adjustments.
 4. **P**= Service VCJ adjustments.
 5. **S**= Service OPTIONS (PICTURE) adjustments.
 6. **X**= Service AFC adjustments.
 7. **"CHK"** = Normal operation of CHANNEL ▲▼ and VOLUME ◀▶.

Figure 14. **Service Mode Menu Adjustments.**

Note: *Only the applicable settings for the Receiver serviced will be available (See a in Fig. 14).*

Exiting the Service Mode:

Press the **Action** and the **Power** buttons on the **Receiver** simultaneously for at least 2 seconds.

THE RECEIVER EXITS SERVICE MODE

The Receiver momentarily shuts off; then comes back on tuned to channel 3 with a preset level of sound. Any programmed channels, channels caption data and some others user defined settings will be erased.

IMPORTANT
Always Exit the Service Mode
Following Adjustments.

Press the **POWER** Button on the Remote Control to select the Service Adjustment.

For Adjustments:

1. Press **Channel Up/Down** on the **Remote Control** to select one of the available Service Adjustments (a in Fig. 14).

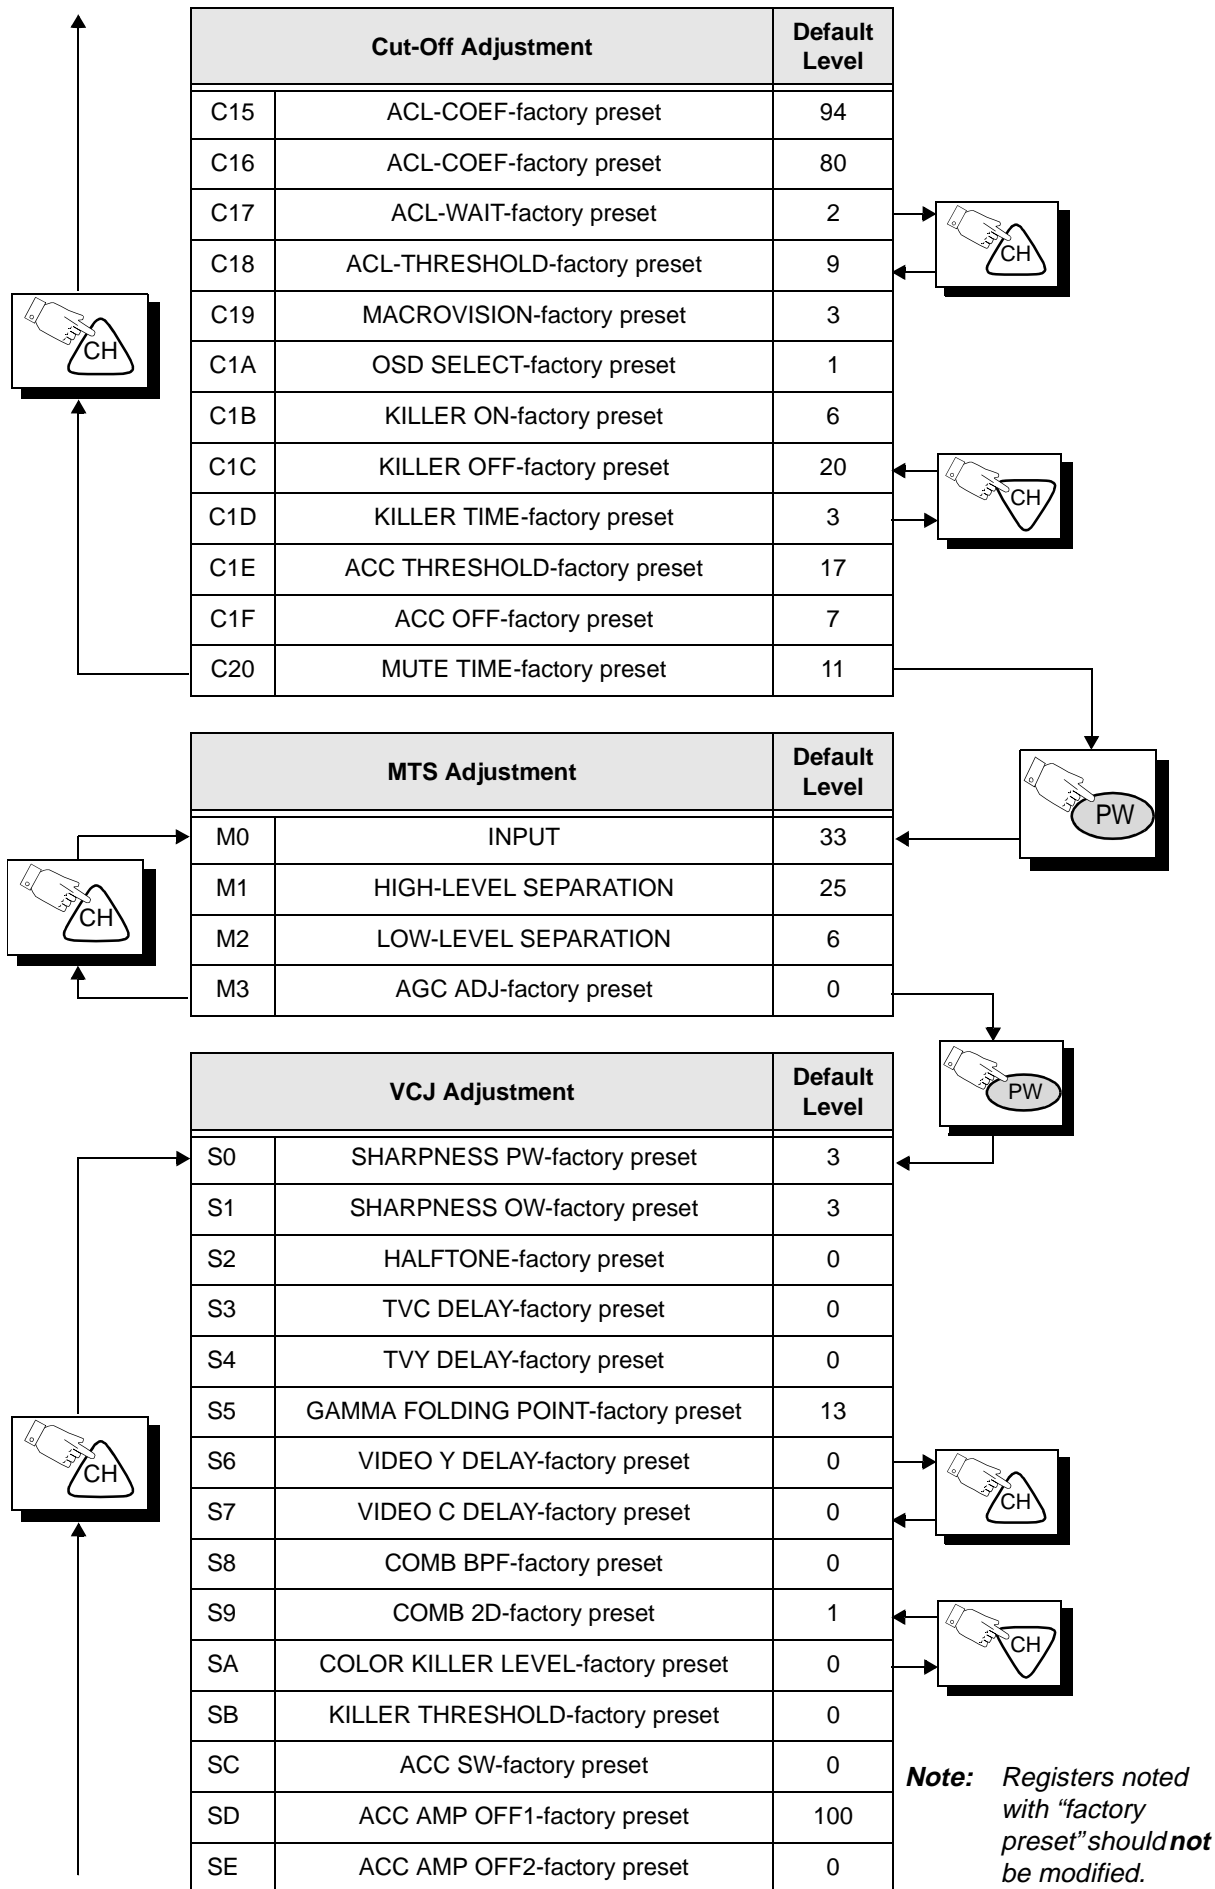

Note: Write Down the original value set (b in Fig. 14) for each address before modifying anything. It is easy to erroneously adjust the wrong item.

2. Press **Volume Up/Down** on the **Remote Control** to adjust the level of the selected Service Adjustment (b in Fig. 14).

Sub-Data Adjustment		Default Level
B0	SUB-COLOR	33
B1	SUB-TINT	36
B2	SUB-BRIGHTNESS	127
B3	SUB-CONTRAST	20
B4	R OFFSET-factory preset	0
B5	YNR-factory preset	0
B6	YNR LIM-factory preset	0

Cut-Off Adjustment		Default Level

Note: Registers noted with "factory preset" should **not** be modified.

To Check Purity:

When Receiver is in Service Mode (red “CHK” is displayed), place a jumper in the AG connector between the terminals (shorting FB signal to ground). Press the **Recall** Button on the **Remote Control** to enter the White Purity Field Check Mode. Remove the jumper from the AG connector and press **Recall** repeatedly to toggle the Receiver into the Red/Green/Blue Purity Field Check Modes.

Note: if jumper is not removed, colors will be displayed at high luminosity.

In Aging Mode (factory mode, yellow “CHK” is displayed), place a jumper in the AG connector between the terminals. Press **Recall** on the **Remote Control** to enter the Purity Field Check Mode.

Helpful Hints

Entering Service Mode (Back-Open Method)

- While the Receiver is ON and operating in Normal Mode, momentarily short test point **FA1** (TP8) to Cold Ground (\rightarrow) **FA2** (TP3) A-Board.
The Receiver enters the Aging Mode.
Yellow letters “CHK” appear in the upper left corner of the CRT.
(The Volume Up/Down will adjust rapidly).
- Simultaneously press the **Action** and the **Volume Up** buttons on the **Receiver Control Panel**.
The Receiver enters the Service Mode.
The letter in “CHK” turn red.
(The Volume Up/Down will adjust normally).
(All customer controls are set to nominal level).

IMPORTANT
Always Exit the Service Mode
Following Adjustments.

Note: Only applicable settings for
the Receiver serviced will be
available.

Notes:

Instructional Flow Chart for Service Mode

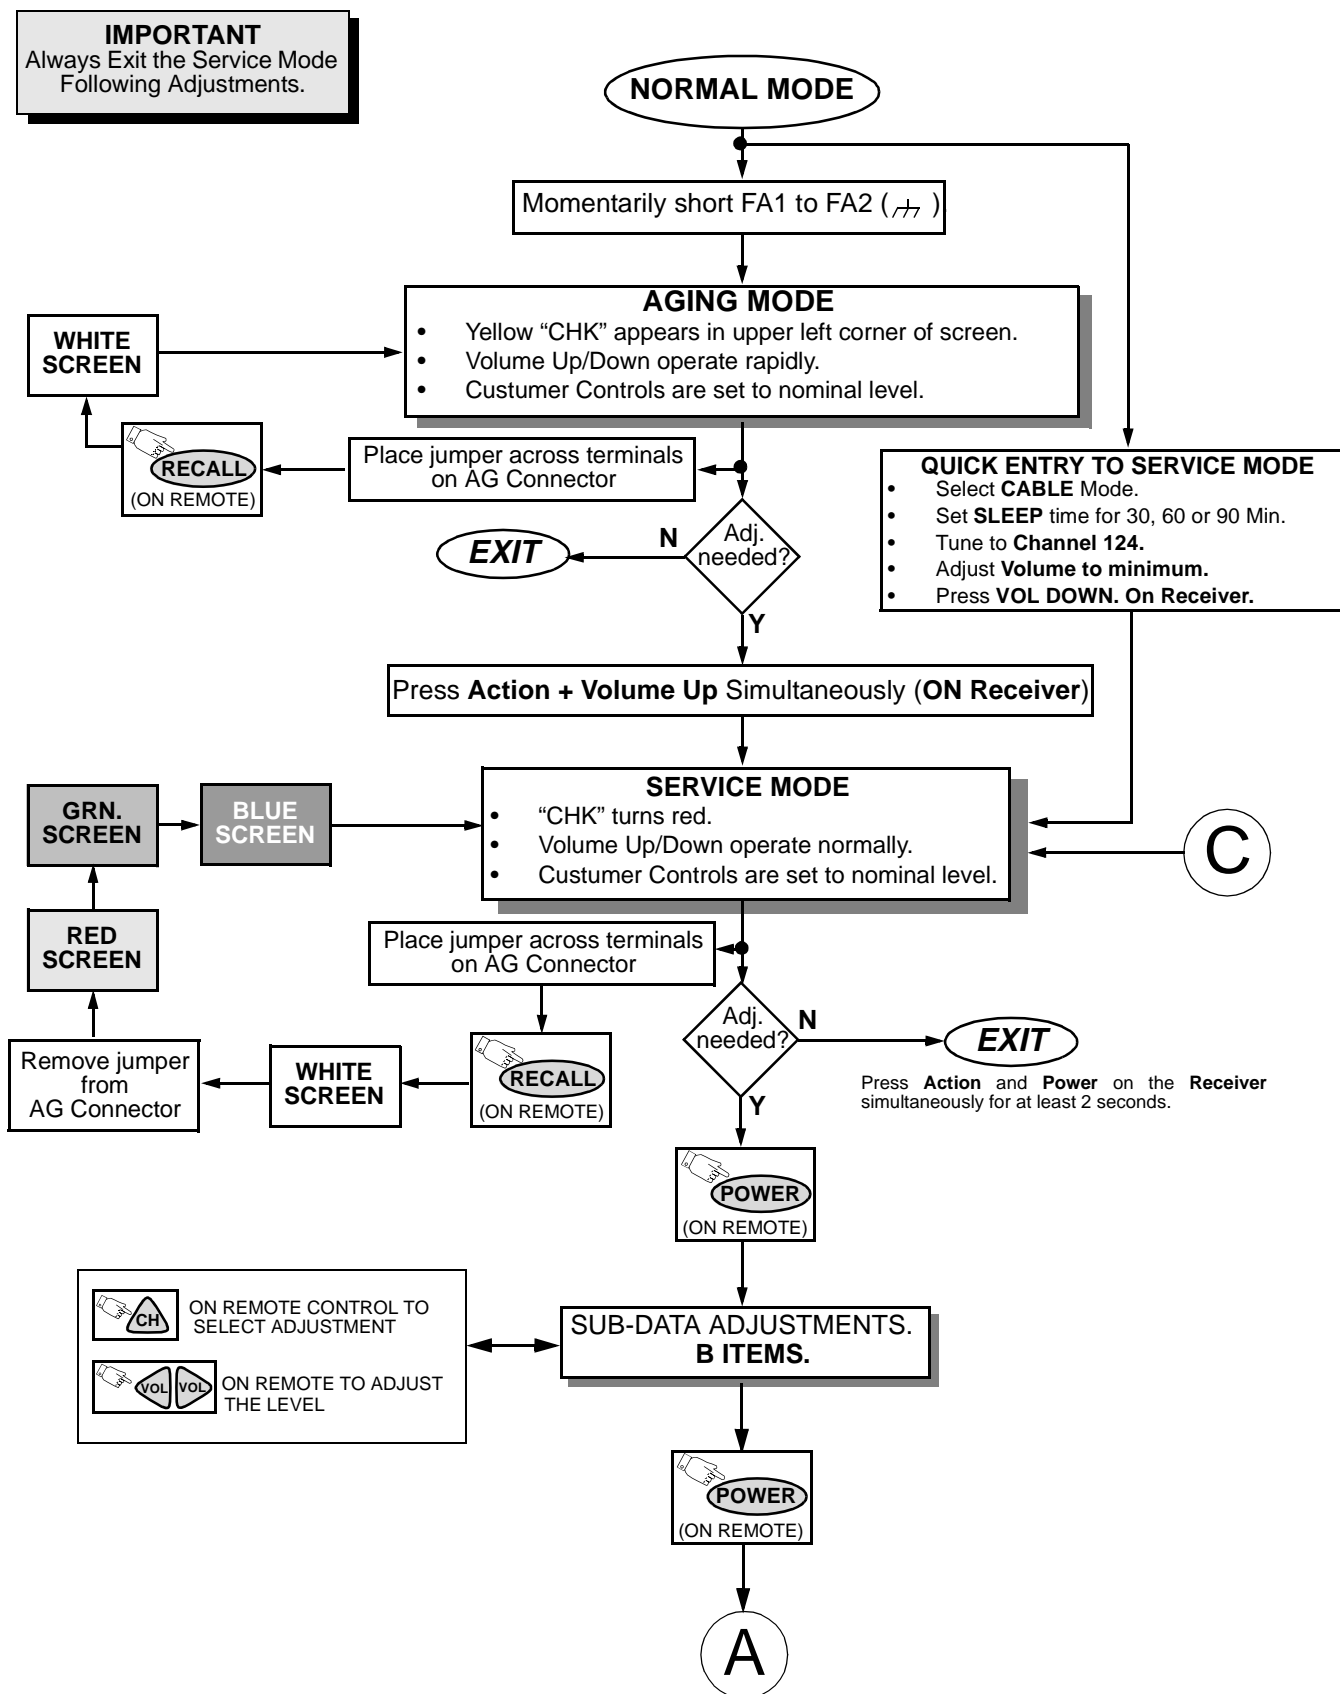

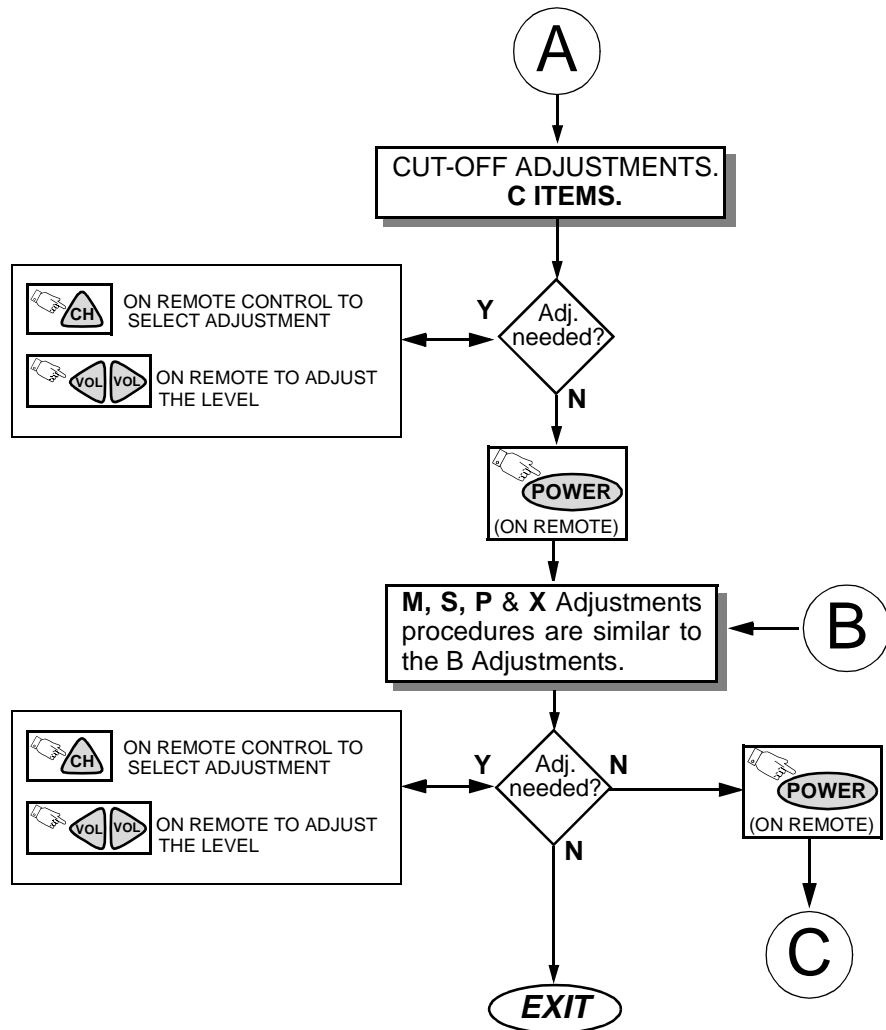

Figure 16. Flow Chart for Service Mode.

Press **Action** and **Power** on the **Receiver** simultaneously for at least 2 seconds.

Note: Only applicable settings for the Receiver serviced will be available.

IMPORTANT
Always Exit the Service Mode
Following Adjustments.

Figure 17. Flow Chart for Service Mode (Cont.)

Service Adjustments (Electronic Controls)

Note: It is recommended to allow for a 30 minute warm up period, at high brightness level (use white screen), prior to any picture adjustment.

Sub-Contrast

Service DAC Adjustment (B3)

This adjustment is factory set. **Do not adjust** unless repairs are made to associated circuit, the CRT Board or when the CRT is replaced.

Preparation:

1. Apply a color bar signal pattern with 87.5% modulation, 70% saturated color bar with a 100 IRE white and 7.5 black.

Note: The pattern used in this procedure is an EIA color bar pattern with 87.5% modulation with 100 IRE white and 7.5 black. Correlate the information in this procedure to the pattern used if another signal is used.

2. Preset the following controls:
 - Brightness Center.
 - Picture Max.
 - Sharpness Center.
 - γ Gamma (S5) 15
 - ACL OFF (CA) 00
 - Cut Off G (C1) 00
3. Connect the oscilloscope to the CRT-Board connector C1-2 (TP35). Set the scope time base to 20 μ s (horizontal).

Procedure:

1. In the Service Mode, select DAC Sub-Contrast Adjustment (B3) and adjust for **2.5 \pm 0.1Vp-p** between white and black level. (See video waveforms detail, Fig. 18).

2. Following adjustments set S5, CA & C1 to their original settings.
3. Turn Receiver OFF and disconnect test equipment.

Sub-Brightness

Service DAC Adjustment (B2)

Due to the characteristics of this chassis, Sub-brightness adjustments are not necessary. For good brightness level set the register to "127", the default level.

Perform "Sub-Brightness Final Adjustment" on page 23 only if a different brightness level is required for the picture.

Tint/Color Adjustment

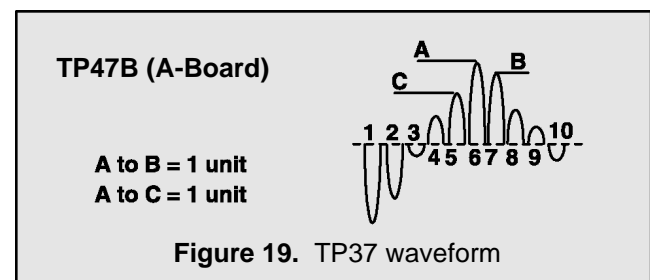

Service DAC Adjustment (B1) (B0)

Preparation:

1. Apply a rainbow color bar signal.
2. Preset the following controls:
 - Brightness Min.
 - Color Center.
 - Tint. Center.
 - Picture Max.
 - Sharpness Min.
 - γ , Gamma (S5) 15
 - ACL OFF (CA) 00
3. Connect the oscilloscope to TP37 (or C1-3).

Procedure:

1. In the Service Mode for making electronic adjustments, select DAC Sub-Tint Adjustment (B1). Adjust until the waveform measured is as the one shown in Fig. 19.

2. Connect the oscilloscope to TP35 (C-Board) and GND.
3. Select DAC Sub-Color Adjustment (B0) and adjust for peak to peak amplitude to be **0.8Vp-p \pm 0.05V** as shown in Fig. 20.

4. Following adjustments, reset controls modified during preparation to their original levels
5. Turn Receiver OFF and disconnect test equipment.

White Balance

Service DACs. (C0) (C1) (C2) (C3) (C4) (C5)

Preparation:

1. Turn the Receiver "ON" and allow 30 minutes warm up at high brightness (white screen).
2. Preset the following DACs:
 - C0: Cut Off_R 0 255
 - C1: Cut Off_G 0 255
 - C2: Cut Off_B 0 255
 - C3: Drive_R 80
 - C4: Drive_G 80

- C5: Drive_B80
3. Confirm using Black & White pattern and a white screen the color balance (gray scale and white balance). If white balance is required perform the following:

Procedure (Low Lights):

1. Apply a Black & White pattern.
2. Connect a jumper from the base of Q452 to cold ground (↗) (or apply +2.5V DC to TP1 to defeat the neck protector circuit).
3. Set the Red and Blue Cut-Off registers (C0 and C2) to 00.
4. On the Remote Control, press R-Tune to get a green horizontal line.
5. Connect the scope between GRN Cathode (GK, on the CRT-Board) and cold ground (↗).
6. View scope trace at Horizontal rate and adjust the Service Mode DAC (C1) level until a scanning period of **195V** above DC ground is measured, as indicated in Fig. 21.

7. Adjust screen VR (on T551, Flyback) until the green line just becomes visible.
8. Press R-Tune (on Remote Control) to display full screen.
9. Select Red Cut-Off register (C0). Press R-Tune to display a green horizontal line. Increase C0 value (using Volume u) until the line turn yellow (mixing green & red).
10. Press R-Tune to display full screen.
11. Select Blue Cut-Off register (C2) and press R-Tune to see the yellow line. Increase C2 value (using Volume u) until the line becomes white (mixing red blue and green).
12. Press R-Tune to display full screen.
13. Confirm that a good gray scale is displayed when viewing a Black & White pattern.
14. EXIT the Service Mode.

White Balance (High Lights)

1. Using a Black and White pattern and white screen adjust Red Drive, C3, and Blue Drive, C5 to obtain good white level on screen. If white looks reddish, decrease C3, if white looks bluish, decrease C5.
2. Exit Service Mode.
3. In Picture menu change Picture and Brightness from low to high scales and observe black and white tracking.
4. If corrections are required, repeat step 1 until the correct balance is achieved.
5. Following satisfactory High Lights adjustment perform the following White Balance Touch-Up.

White Balance Touch-Up Procedure:

Use this procedure to make minor adjustment to white balance.

1. Enter Service Mode.
2. Apply a black and white (B/W) signal (signal that includes gray tones).
3. Observe low and high brightness areas of a B/W picture for proper tracking. Adjust the following as required for “good gray scale and warm highlights”:
 - HIGH LIGHT areas – Adjust Red Drive (C3) and Blue Drive (C5) registers until picture appear best for warm whites.
 - LOW LIGHT areas – adjust Red Cut-Off (C0) and Blue Cut-Off (C2) registers until best picture for black-gray.

Due to effect from low level adjustment on high level adjustment, it is recommended that this procedure is done at the end of the adjustments procedure.

4. Exit Service Mode.
5. Remove all external connections made to the Receiver.

Sub-Brightness Final Adjustment

Service DAC Adjustment (B2)

This adjustment should be made last, following other picture adjustments.

Preparation:

1. Turn the Receiver ON and allow 20 minute warm up at high brightness (white screen).
2. Apply a black and white cross pattern.
3. Set PICTURE to Max.
4. Set BRIGHT to Center.

Procedure:

1. In Service Mode, select Sub Bright register (B2).
2. Adjust B2 until the 7.5 IRE section looks same as 3.0 IRE section as seen in Fig. 22.

Figure 22. Sub-bright adjustment

3. Exit Service Mode.

Horizontal Centering

Service DAC Adjustment (C9)

Preparation:

Connect a monoscope generator.

Procedure:

1. In the Service Mode, select the Horizontal Centering Adjustment DAC (C9). Adjust it until locations “A” and “B” are even on both sides of screen, as indicated in Fig. 23.
2. EXIT the Service Adjustment Mode.

Figure 23. Horizontal Centering

Vertical Size

Service DAC Adjustment (C6)

Preparation:

Connect a monoscope pattern.

Procedure:

1. In the Service Mode, select the Vertical Size Adjustment DAC (C6). Adjust until a perfect circle appears (Upper and lower sections of circle may extend beyond the screen and therefore not visible). See Fig. 24.

Figure 24. Vertical Size

2. EXIT the Service Adjustment Mode.

MTS Circuit Adjustments

The MTS Circuit Adjustments require two steps:

1. Input Level Adjustment.
2. Stereo Separation Adjustment.

Input Level Adjustment (M0)

Preparation:

1. Connect an RMS meter with filter jig as shown in Fig. 25.

Figure 25. Filter Jig

2. Connect an RF signal generator to the RF antenna input.

Procedure:

1. Apply the following signal from the RF signal generator:
Video: 100 IRE flat field, 30% modulation.

Audio: 300Hz, 100% modulation, monaural (70 ±5dB, 75Ω OPEN, P/S 10dB).

2. Adjust the MTS Input Level Adjustment (M0) until the voltage measured is 106 ± 6.0mV rms.

Stereo Separation Adjustment (M1 & M2)

Preparation:

1. Connect an RF signal generator to the RF antenna input.
2. Connect a scope to TPE10.

Procedure:

1. Select Stereo Mode in Audio menu
2. Apply the following signal from the RF signal generator:
Video: 100 IRE flat field, 30% modulation.
Audio: 300Hz, 100% modulation, stereo (left only) (70 ±5dB, 75Ω OPEN, P/S 10dB).
3. Adjust the MTS Low-Level Separation Adjustment (M2) until the amplitude displayed on the scope is minimum.
4. Apply the following signal from the RF signal generator:
Video: 100 IRE flat field, 30% modulation.
Audio: 3KHz, 100% modulation, stereo (left only) (70 ±5dB, 75Ω OPEN, P/S 10dB).
5. Adjust the MTS High-Level Separation Adjustment (M1) until the amplitude displayed on the scope is minimum. Repeat above steps 2 through 5 until the amplitude is at minimum for both signals.

Clock Adjustment (X3)

Preparation:

Connect the frequency counter from TP5 (IC001 Pin 11) to cold ground (---).

Note: Frequency Counter probe capacitance should be 8pF or less.

Procedure:

1. Turn the Receiver "OFF" with the AC power applied.
2. Measure TP5 (IC001 pin 11) for the frequency of the waveform and record the reading.

Note: Pin 11 measurement must have at least four digits of resolution following the decimal point.
Example: 000.0000

3. Turn the Receiver back "ON".
4. Place the Receiver into Service Mode for making electronic adjustment, select the Clock Adjustment DAC (X3).
5. Calculate and set X3 based on the following formula:

$$X3 = 128 + 0.9 \times 10^6 \frac{(TP5 - 125)}{125}$$

Note: Pin 11 measurement will not change regardless of the value stored in X3.

Service Adjustments (Mechanical Controls)

Focus (part of T551)

Preparation:

Connect a Signal generator and select a dot pattern.

Procedure:

Adjust the FOCUS control VR to obtain the sharpest and clearest dot pattern.

- a. Adjust for best center.
- b. Adjust for best area between the center and top right corner.

Identification of Components

Figure 26. Back Cover Removal (CT-25G6/CE/UE & CT-27G6/DE/UE)

Figure 27. Back Cover Removal (SP-2724E/UE)

Note: After servicing the Receiver, dress cables and wires as indicated.

Figure 28. Rear View

Figure 29. C-Board component locations

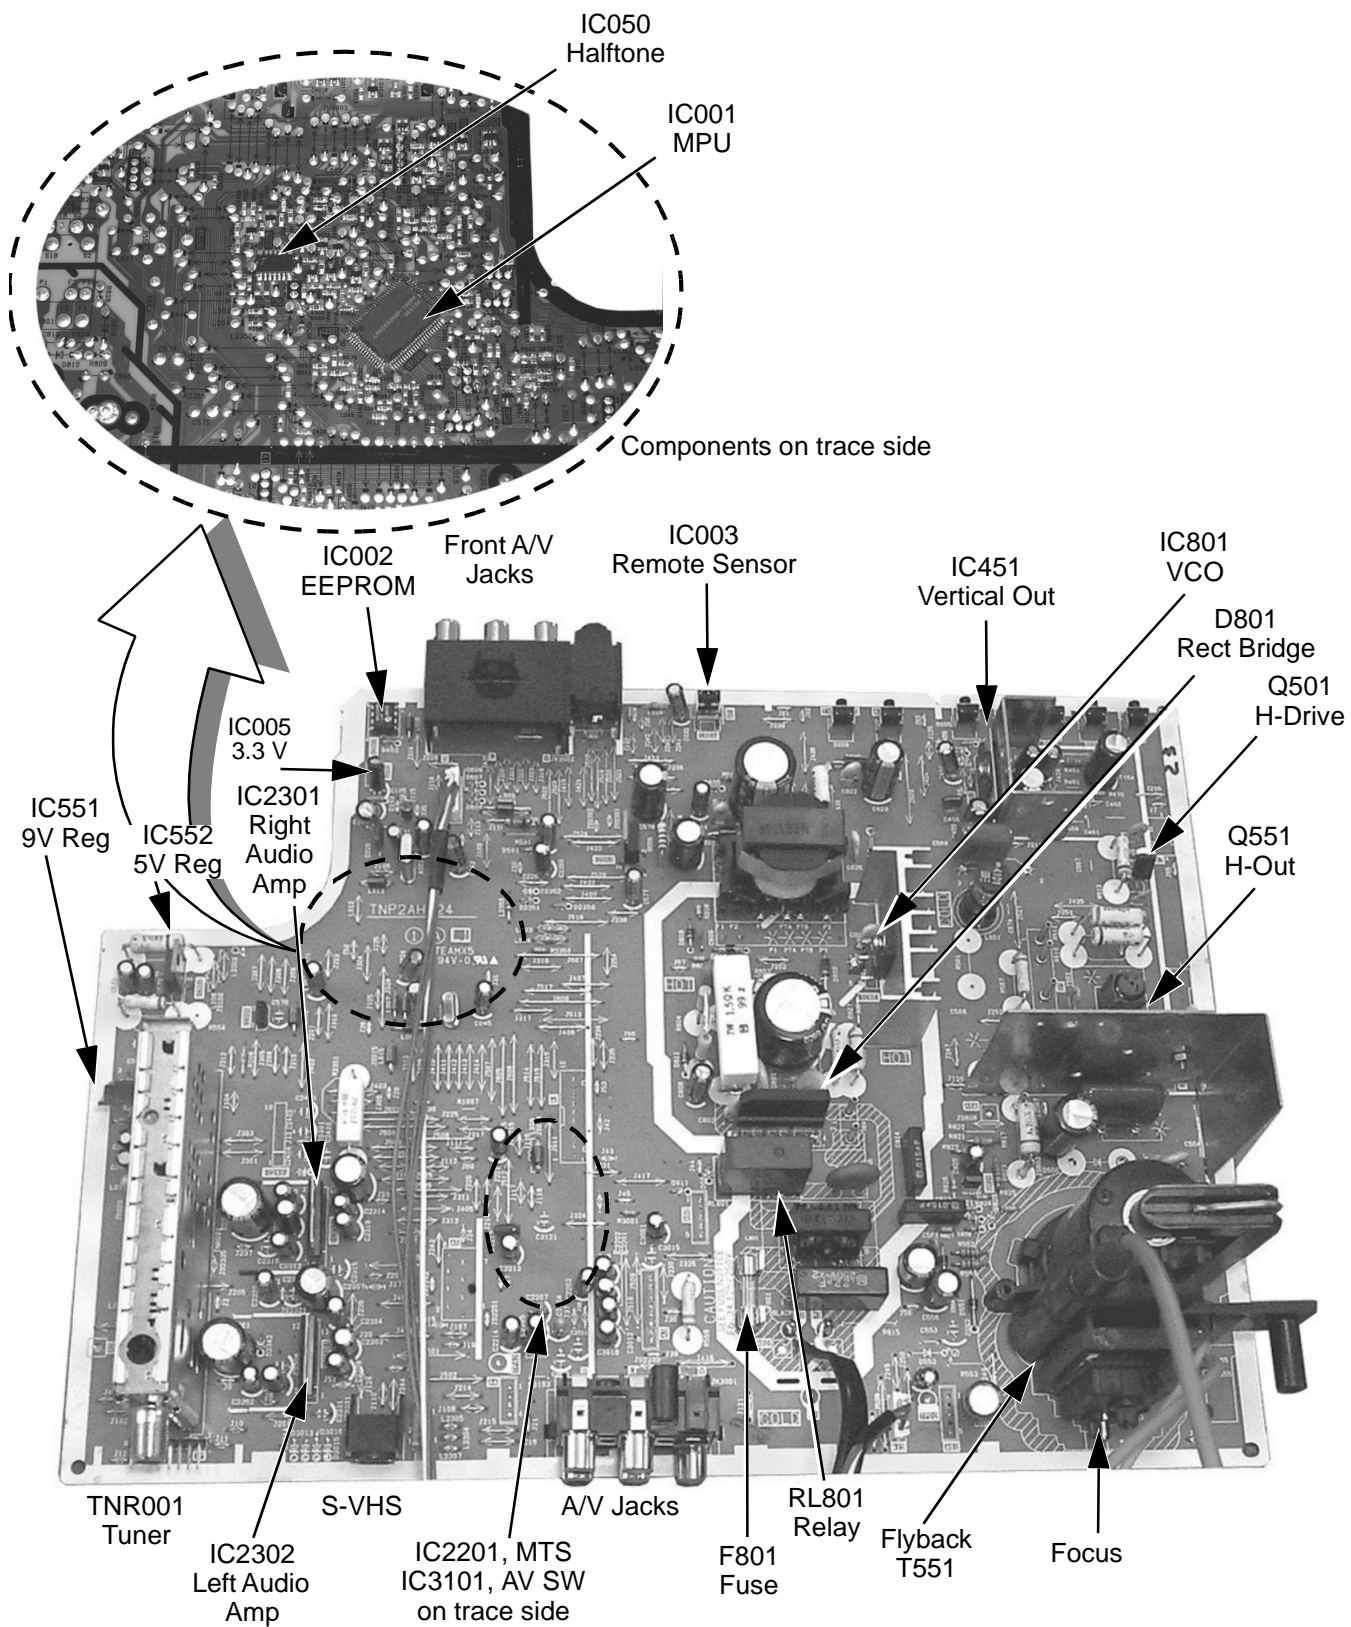

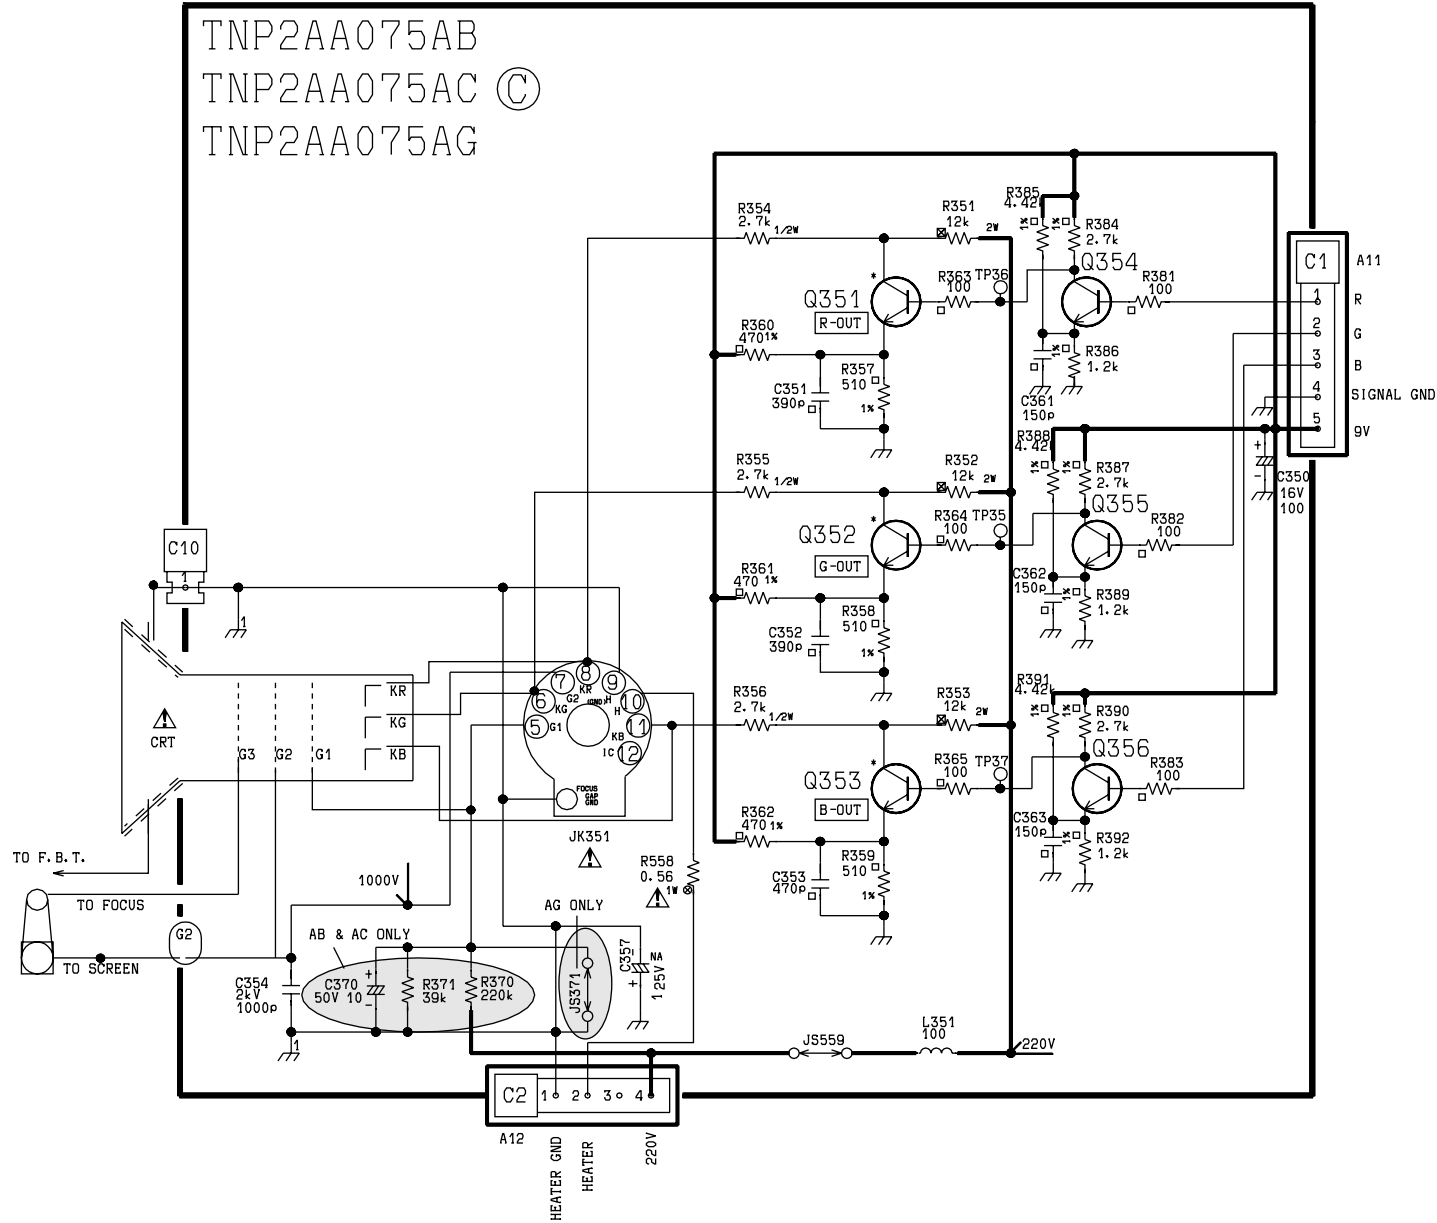

Figure 30. A-Board, location of components

Notes:

- Check Parts List for most recent component values and part numbers.
- Obtain voltages with a digital multimeter.
- The board layouts were modified to enhance and display traces otherwise hidden by a mask.

CHIP TRANSISTOR
LEAD DESIGNATION

IDENTIFICACIÓN DE TERMINALES
PARA TRANSISTORES EN CHIP

Notas:

- Verifique los números de parte de los componentes y sus valores en la lista de partes.
- La medición de los voltajes se hizo con un Voltímetro Digital.

A-BOARD WAVEFORMS -- FORMAS DE ONDA TARJETA A

WAVEFORMS -- FORMAS DE ONDA
ALL MODELS - TODOS LOS MODELOS

* With S-VHS Input

Medición de Formas de Onda

1. Un símbolo como ③ indica el punto para medir una señal. (La medición puede hacerse en el punto con mayor accesibilidad, siempre que sea común al indicado.)
2. Se midieron utilizando un generador con formato NTSC conectado a la terminal de la antena. (Patrón de 8 Barras de Colores EAI, formato NTSC de 100 IREs para el Blanco y 7.5 IREs para el Negro.)
3. Los ajustes de usuario de los Menus PICTURE y AUDIO se normalizaron. Posteriormente el nivel de volumen se ajusta al mínimo.
4. Las formas de onda de Video y Color fueron tomadas con un osciloscopio de banda alta y con

una punta de prueba de baja capacitancia (10 a 1). La forma y amplitud de las ondas puede variar según el tipo de osciloscopio que se utilice y sus características.

5. El símbolo de tierra ↓ que aparece junto al número de la forma de onda, indica que se utiliza conexión a **Tierra Caliente** en el extremo negativo de la punta de prueba.

PRECAUCION: Si no se utiliza la conexión a la tierra adecuada, se obtendrán mediciones equivocadas y podría dañar el equipo de medición.

Waveform Measurements

1. ③ indicates waveform measurement. (Measurement can be taken at the best accessible location in common to the indicated point.)
2. Taken with an NTSC signal generator connected to the antenna terminal. (NTSC color bar pattern of 8 bars of EIA colors, 100 IRE white and 7.5 IRE black.)
3. Customer Controls (Picture/Audio Menu) are set to Normalize. Volume is set to "MIN".
4. All video and color waveforms are taken with a wideband scope and a probe with low capacitance (10 to 1). Shape and peak altitudes may vary depending on the type of Oscilloscope used and its settings.
5. Ground symbol ↓ shown on waveform number indicates (Hot) ground lead connection of the Oscilloscope.

CAUTION: Incorrect ground connection of the test equipment will result in erroneous readings.

NOTA DE SEGURIDAD

LOS DIAGRAMAS ELÉCTRICOS INCLUYEN CARACTERÍSTICAS ESPECIALES MUY IMPORTANTES PARA LA PROTECCIÓN CONTRA RAYOS-X, QUEMADURAS Y DESCARGAS ELÉCTRICAS. CUANDO SE DE SERVICIO ES IMPORTANTE USAR PARA REEMPLAZO DE COMPONENTES CRÍTICOS, SOLO PARTES ESPECIFICADAS POR EL FABRICANTES. LOS COMPONENTES CRÍTICOS ESTAN SEÑALADOS EN LOS DIAGRAMAS POR EL SIMBOLO ⚠.

IMPORTANT SAFETY NOTICE

THIS SCHEMATIC DIAGRAM INCORPORATES SPECIAL FEATURES THAT ARE IMPORTANT FOR PROTECTION FROM X-RADIATION, FIRE AND ELECTRICAL SHOCK HAZARDS. WHEN SERVICING IT IS ESSENTIAL THAT ONLY MANUFACTURERS SPECIFIED PARTS BE USED FOR THE CRITICAL COMPONENTS DESIGNATED WITH A ⚠ IN THE SCHEMATIC.

Schematic Notes

IMPORTANT SAFETY NOTICE

THIS SCHEMATIC DIAGRAM INCORPORATES SPECIAL FEATURES THAT ARE IMPORTANT FOR PROTECTION FROM X-RADIATION, FIRE AND ELECTRICAL SHOCK HAZARDS. WHEN SERVICING IT IS ESSENTIAL THAT ONLY MANUFACTURERS SPECIFIED PARTS BE USED FOR THE CRITICAL COMPONENTS DESIGNATED WITH A  IN THE SCHEMATIC.

CHIP TRANSISTOR LEAD DESIGNATION

SCHEMATIC NOTES

1. Resistors are carbon 1/4W unless noted otherwise.
 2. Capacitors are ceramic 50V unless noted otherwise.
 3. Coil value notes is inductance in μH .
 4. Test point indicated by  ; Test point but no pin .
 5. Components indicated with  are critical parts and replacement should be made with manufacture specified replacement parts only.
 6.  (**BOLD LINE**) indicates the route of B+ supply.
 7. The schematic diagrams are current at the time of printing and are subject to change without notice.
 8. Ground symbol  indicates **HOT GROUND CONNECTION**;  indicates COLD GROUND.
- NOTE: All other component symbols are used for engineering design purposes.*

VOLTAGE MEASUREMENTS

1. Voltage measurement:
 - AC input to the Receiver is 120V. NTSC (HD, 1125i & 525P when applicable) signal generator is connected to the antenna of the Receiver. (Color bar pattern of 100 IRE white and 7.5 IRE black.)
 - All Picture and Audio adjustments are set to Normalize.
TV ANT/CABLE - (Set-Up Menu) in TV/ANT Mode
Volume - Min.
TV/Video SW - TV position
Audio Mode - Stereo
 - Voltage readings are nominal and may vary $\pm 10\%$ on active devices. Some voltage reading will vary with signal strength and picture content.
 - Supply voltages are nominal.
 2. Ground symbol  indicates ground lead connection of meter. Incorrect ground connection will result in erroneous readings.
- CAUTION: Incorrect ground connection of the test equipment will result in erroneous readings.**

WAVEFORM MEASUREMENTS

1.  indicates waveform measurement. (Measurement can be taken at the best accessible location in common to the indicated point.)
 2. Taken with an NTSC signal generator connected to the antenna terminal. (NTSC color bar pattern of 8 bars of EIA colors, 100 IRE white and 7.5 IRE black.)
 3. Customer Controls (Picture/Audio Menu) are set to Normalize. Volume is set to "MIN".
 4. All video and color waveforms are taken with a wideband scope and a probe with low capacitance (10 to 1). Shape and peak altitudes may vary depending on the type of Oscilloscope used and its settings.
 5. Ground symbol  shown on waveform number indicates (Hot) ground lead connection of the Oscilloscope.
- CAUTION: Incorrect ground connection of the test equipment will result in erroneous readings.**

Schematic Notes

NOTA DE SEGURIDAD

LOS DIAGRAMAS ELÉCTRICOS INCLUYEN CARACTERÍSTICAS ESPECIALES MUY IMPORTANTES PARA LA PROTECCIÓN CONTRA RAYOS-X, QUEMADURAS Y DESCARGAS ELÉCTRICAS. CUANDO SE DE SERVICIO ES IMPORTANTE USAR PARA REEMPLAZO DE COMPONENTES CRITICOS, SOLO PARTES ESPECIFICADAS POR EL FABRICANTES. LOS COMPONENTES CRITICOS ESTAN SEÑALADOS EN LOS DIAGRAMAS POR EL SIMBOLO \triangle .

IDENTIFICACIÓN DE TERMINALES PARA TRANSISTORES EN CHIP

NOTAS DE LOS DIAGRAMAS

- Las Resistencias son de Carbón de 1/4W, a menos que se indique otra característica.
 - Los Capacitores son de Cerámica para 50V, a menos que se indique otra característica.
 - El valor indicado de las Bobinas es la inductancia expresada en μ H.
 - Los puntos de prueba en la terminal de algún componente son indicados por \uparrow . Los puntos de prueba fuera de los componentes se indican con \uparrow .
 - Los componentes señalados con el símbolo \triangle son considerados componentes críticos y deben ser reemplazados sólo con las partes especificadas por el fabricante.
 - (LINEA GRUESA)** indica las líneas de alimentación de los Voltajes B+.
 - Los diagramas eléctricos están sujetos a cambio sin previo aviso.
 - El símbolo \downarrow indica que es una conexión a **Tierra Caliente** y el símbolo \nearrow indica conexión a **Tierra Fría**.
- NOTA:** Los demás símbolos de componentes incluidos son usados con fines de diseño.

MEDICIÓN DE VOLTAJES

- Medición de voltaje:
 - El voltaje de entrada al Receptor es de 120V de Corriente Alterna. Un generador de patrones con formato NTSC se conecta a la entrada de la antena. (Patrón de Barras de Colores con 100 IREs para el Blanco y 7.5 IREs para el Negro.)
 - Los ajustes de los Menus Picture y Audio se normalizan. En el Menú Set-Up, en la opción ANTENA, se selecciona el modo de CABLE. El nivel de Volumen se minimiza. De los modos TV y Video, seleccionar el modo TV. Seleccionar modo Estereo del Audio.
- Las mediciones de los voltajes son nominales y pueden variar hasta 10% en componentes en funcionamiento. Las lecturas de los voltajes pueden variar por la potencia de la señal y el contenido de la imagen.
 - Las fuentes de voltajes son nominales.
- El símbolo \downarrow indica el tipo de tierra que se utiliza en la conexión del medidor.

PRECAUCION: Si no se utiliza la conexión a la tierra adecuada, se obtendrán mediciones equivocadas y podría dañar el equipo de medición.

MEDICIÓN DE FORMAS DE ONDA

- Un símbolo como $\textcircled{3}$ indica el punto para medir una señal. (La medición puede hacerse en el punto con mayor accesibilidad, siempre que sea común al indicado.)
- Se midieron utilizando un generador con formato NTSC conectado a la terminal de la antena. (Patrón de 8 Barras de Colores EAI, formato NTSC de 100 IREs para el Blanco y 7.5 IREs para el Negro.)
- Los ajustes de usuario de los Menus PICTURE y AUDIO se normalizaron. Posteriormente el nivel de volumen se ajusta al mínimo.
- Las formas de onda de Video y Color fueron tomadas con un osciloscopio de banda alta y con un punta de prueba de baja capacitancia (10 a 1). La forma y amplitud de las ondas puede variar según el tipo de osciloscopio que se utilice y sus características.
- El símbolo de tierra \downarrow que aparece junto al número de la forma de onda, indica que se utiliza conexión a **Tierra Caliente** en el extremo negativo de la punta de prueba.

PRECAUCION: Si no se utiliza la conexión a la tierra adecuada, se obtendrán mediciones equivocadas y podría dañar el equipo de medición.
